Success in R→O: the NLDAS experience

Initial partners: NCEP/EMC (Mitchell), NWS/OH (Schaaake) NASA/GSFC (Houser), Princeton (Wood), U Washington (Lettenmaier), Rutgers (Robock)

Timeline:

~2000 – 2006: (Research phase)

- Develop/improve NCEP Land surface model, Noah, based on state-of-the-art modeling. Noah made its way into GFS and CFSv2;
- Long-term (1948-~2000) forcing data set over CONUS that provided ‘hindcast’ forcings (U Washington);
- Development of the approach for objective drought monitoring based on LSM and SM percentile index (Princeton);

A simulated soil moisture based drought analysis for the United States

Justin Sheffield,¹ Gopi Goteti,² Fenghua Wen,³ and Eric F. Wood¹

Received 30 June 2004; revised 7 October 2004; accepted 25 October 2004; published 29 December 2004.

[1] Droughts have severe economic, environmental and social impacts. Timely determination of the current level of drought may aid the decision making process in reducing the impacts from drought. In this study, high-resolution, land surface hydrology simulations using the Variable Infiltration Capacity (VIC) model are used to derive a hydrologically based drought index. Soil moisture data from a retrospective simulation from 1950 to 1999 over the continental United States are used to develop probability distributions of monthly average soil moisture, and the relative position of

Success in R→O: the NLDAS experience

Initial partners: NCEP/EMC (Mitchell), NWS/OH (Schaaake) NASA/GSFC (Houser), Princeton (Wood), U Washington (Lettenmaier), Rutgers (Robock)

Timeline:

~2006-2010: (Operational capability phase)

- Develop experimental seasonal hydrological forecasting system based on CFSv1, CPC seasonal outlooks and ESP-method (UW and PU)
- Transfer NLDAS multi-LSM objective drought monitoring and seasonal hydrological forecasting system to EMC (Princeton)

~2010-2012 phase (operational stalled phase)

- Drought monitoring to become operational by NCO – ongoing?
- Seasonal hydrological forecasting system at EMC gets “broken” Feb 2012
- Implementation of CFSv2 into the seasonal hydrological (drought) forecast system, upgraded at Princeton, on-going at EMC.

Research partners “Operational Testbed” at Princeton (Drought Monitoring)

About the Project

Drought Forecast Verifications

As of 201205, all the CFS forecasts have been switched to CFSv2.

Available period: 200806 200807 200808 200809 200810 200811 200902 200903 200904 200905 200906 200907 201005 201006 201007 201008 201009 201010 201011 201012 201101 201102 201103 201104 201105 201106 201107 201108 201109 201110 201111 201112 201201 201202 201203 201204 201205 201206 201207 201208 201209 201210

Target Month	CFS-based Forecast (full) released on 201208	CFS-based Forecast (most likely) released on 201208	CPC Outlook-based Forecast released on 201208	ESP Forecast released on 201208	Nowcast (monthly mean)
Initial condition					
201208					
201209					
201210					
201211					
201212					

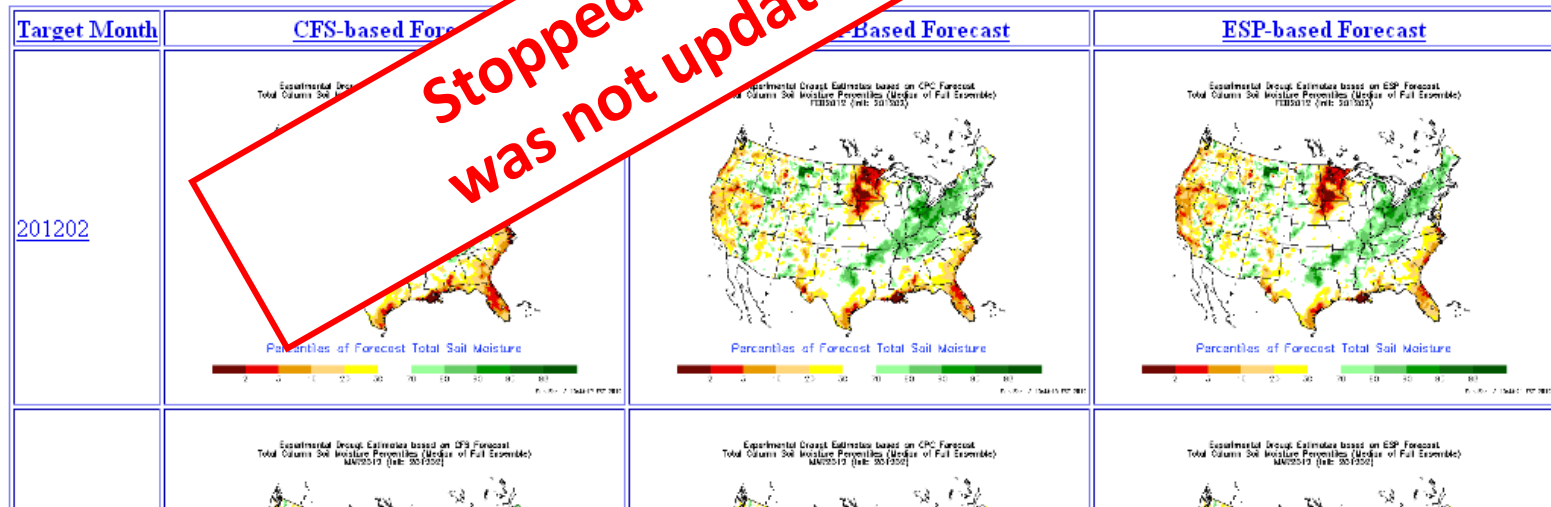

The system developed by Princeton University and University of Washington was transitioned to NCEP/EMC in July 2008, and now it is run as the EMC experimental forecast system.

Drought Forecast using 201202 Initial Condition

How to read forecast maps

Forecast Maps

- These forecasts are produced monthly at the beginning of each month using the initial condition that is the first day of the month.
- The CFS-base forecast uses all CFS seasonal forecast initialized during the previous month. For example, to make seasonal drought forecast starting from 20080701, we use CFS forecast initialized during 20080701 to 20080731 (62 members) to form the forecast distribution before the merging method.
- The CPC outlook-based forecast uses the CPC output releases during the previous month as the forecast distribution. For example, to make seasonal drought forecast starting from 20080801, we use CPC outlook released during 20080701 to 20080731 as the forecast distribution.
 - Each column is the 6-month soil moisture forecast from one forecast approach, and each row is the 6-month soil moisture forecast for each individual month, showing monthly average.
 - Since we are doing ensemble forecast, we use 20 members for each forecast approach.
- The first column is CFS-based forecast using 20 ensemble members to calculate the median, the second column is CPC outlook-based forecast using 20 members, and the third column is Ensemble Streamflow Simulation (ESS) forecast using 20 members.
 - NLDAS drought forecast includes 10 members and forecast probability analysis.
 - More system descriptions and details are available in the [National Seasonal Hydrological Forecast System](#).

Data and computational challenges for drought monitoring and forecasting R→O

1. Data.

It should be noted that CFSR is unavailable after 2009; that only a reduced resolution of CFSv2 reforecasts are available at NCDC; and there is no archive available to the research community of CFSv2 forecasts after the 7-day posting of real-time forecasts at NCEP. So how can research into the 2011 and 2012 droughts be carried out? Or developing improved drought forecasts in general?

2. Computational challenges for hydrologic seasonal forecasts.

Monitoring, currently operationalized at EMC, 4 LSM with deterministic initial conditions and forcings.

Forecasting, currently at Princeton, 3 forecast models, 20 ensembles, 9 months, 1 LSM, deterministic initial land conditions = 45 simulation years/forecast start date. Under NLDAS with 4 LSM, 180 years/forecast. Under NMME (6 models) +CPC official outlook+ESP, 4 LSM = 480 years/forecast (still with deterministic initial conditions.)

Summary and lessons learned of NLDAS drought R→O experience

From 2000-2010, NLDAS R→O drought monitoring system was successful because of a sustained partnership between NCEP and university partners

From 2010-2012 the R→O efforts weakened due to CPO moving away from “core” funding towards smaller R-based funding. Also within-NCEP transition from “operational capability” (experimental operations) to “operations” lagged due to CPC-EMC-NCO challenges?

2012 – forward. To what extent will NCEP operational products benefit from CPO investments in research (e.g. NMME) if there isn't a clear path to support transition to operations (i.e. stable funding to the CTB?)

From 2010-2012 the R→O efforts weakened due to CPO moving away from “core” funding towards smaller R-based funding. Also within-NCEP transition from “operational capability” (experimental operations) to “operations” lagged due to CPC-EMC-NCO challenges?

2012 – forward. To what extent will NCEP operational products benefit from CPO investments in research (e.g. NMME) if there isn't a clear path to support transition to operations (i.e. stable funding to the CTB?)

Computational challenges for drought monitoring and forecasting

An additional hidden issue never discussed within NCEP/CTB/CPO is the operational developments in OH and the RFOs. They are implementing at RFCs seasonal hydrological forecasting based on CFSv2. Where's the discussion?.
